

ANNUAL PROGRESS REPORT

for the contract

"SCIENTIFIC COMMUNICATION RESEARCH IN SPACE BIOLOGY"

Contract Number - NSR 09 010 027

to the

Bioscience Programs Division
Office of Space Sciences and Applications
National Aeronautics and Space Administration

from

Biological Sciences Communication Project
The George Washington University

for the period

January 1, 1967 - December 31, 1967

submitted

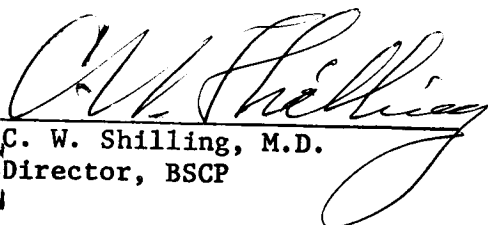

December 29, 1967

TABLE OF CONTENTS

I. Preface	Page i
II. Bibliography	1
III. Permuted Title Index	13
IV. Author Index	20

I. Preface

PREFACE

The citations listed in these bibliographies were compiled from the files of the Biological Sciences Communication Project for their relevancy to the areas of interest of the National Aeronautics and Space Administration's Office of Planetary Quarantine.

Volume I, Policy, includes references related to analysis of the sterilization requirements, conference proceedings and background information on NASA's position concerning spacecraft sterilization and planetary quarantine.

Volume II, Environmental Microbiology, is concerned with citations involving microbial growth, detection, identification and monitoring throughout spacecraft fabrication. Citations involving contamination control are relatively few, since this area was covered in an earlier bibliography.

Volume III, Engineering Parameters, incorporates material on air sampling, development and testing of spacecraft components, instrumentation, sterilization and decontamination procedures and spacecraft design.

These three volumes, together with two previously published (CLEAN ROOMS, ETHYLENE OXIDE), comprise over 1,200 citations bearing on the spacecraft sterilization problem. Their purpose is to provide essential background material for the further development and publicizing of the planetary quarantine program in the United States.

II. Policy Bibliography

1. LEDERBERG, J. Can we keep Mars clean? Wash. D.C., the Washington Post Co. 1 p.
2. PITTEDRIGH, C.S. Biology and the exploration of Mars. NASA (Contr. NASr-239). Wash. D.C. Space Science Board. 19 p.
3. SAGAN, C., Editor. Unpublished review of the literature (relevant to the question of Mars probe sterilization). Appendix I. 33 p.
4. SAGAN, C. AND COLEMAN, S. Biological Contamination of Mars. III Standards for Spacecraft sterilization. Source not identified. 19 p.

III. Permuted Index

Key words in the title of each of the articles referenced in this work have been rotated to the beginning of the title and alphabetized.

Thus, if one should search for "U.S. space science program" it would appear alphabetically at the beginning of the line for all titles in which it actually occurs.

The number at the right refers to the bibliographical citation number.

I. Preface

PREFACE

The citations listed in these bibliographies were compiled from the files of the Biological Sciences Communication Project for their relevancy to the areas of interest of the National Aeronautics and Space Administration's Office of Planetary Quarantine.

Volume I, Policy, includes references related to analysis of the sterilization requirements, conference proceedings and background information on NASA's position concerning spacecraft sterilization and planetary quarantine.

Volume II, Environmental Microbiology, is concerned with citations involving microbial growth, detection, identification and monitoring throughout spacecraft fabrication. Citations involving contamination control are relatively few, since this area was covered in an earlier bibliography.

Volume III, Engineering Parameters, incorporates material on air sampling, development and testing of spacecraft components, instrumentation, sterilization and decontamination procedures and spacecraft design.

These three volumes, together with two previously published (CLEAN ROOMS, ETHYLENE OXIDE), comprise over 1,200 citations bearing on the spacecraft sterilization problem. Their purpose is to provide essential background material for the further development and publicizing of the planetary quarantine program in the United States.

III. Permuted Index

Key words in the title of each of the articles referenced in this work have been rotated to the beginning of the title and alphabetized.

Thus, if one should search for "survival of Gram-negative bacteria in the environment" it would appear alphabetically at the beginning of the line for all titles in which it actually occurs.

The number at the right refers to the bibliographical citation number.

Sampler for airborne bacteria/A new	205
Sampler/Preliminary design, ENCAR-1 rocket-borne cryogenic air	256
Samplers/The use of plastic Petri dishes in Andersen aerosol	235
Sampling at altitude/Microorganisms of the upper atmosphere. I	301
Sampling method upon the apparent response of airborne bacteri	64
Sampling of surfaces; the vacuum probe sampler/A new approach	325
Sanitary bacteriology/The membrane filter in	22
Sanitation in the space age/	136
Sanitization/Sterilization, disinfection, fumigation and	2
Self-sterilizing resins/Procedure for evaluation of	147
<u>Serratia marcescens</u> /Variations in the aerial viability associa	61
<u>Serratia marcescens</u> after short-time exposure to ultraviolet ir	93
<u>Serratia marcescens</u> and spores of <u>Bacillus subtilis</u> var. <u>niger</u> /	65
<u>Serratia marcescens</u> dehydrated by concentrated glycerol and suc	151
<u>Serratia marcescens</u> in air/Relative humidity and the killing of	108

<u>Shigella sonnei</u> on cotton, glass wood, paper, and metal at vari	144
Simulated space/Study of viability of microorganisms in	123
Size of microbiological aerosols/Adequate expression for avera	159
Skin: A comparison of povidon-iodine with other agents used fo	140
Skin/Aerobic bacteria of the human	302
Skin carriage of bacteria in the human/	303
Skin/Factors affecting the rapid disappearance of bacteria pla	20
Sodium chloride and pH on the outgrowth of spores of Type E <u>Cl</u>	295
Soil by irradiation and some further observations on soil enzy	141
Soil mineral particles/Dry heat survival <i>Bacillus subtilis</i> var.	275
Solar panel/Investigation of bacterial contamination inside	98
Solar radiations at various humidities/Stability of disseminat	76
Solid propellant/Investigation of microbial contamination insid	121
Solids/Microbiological techniques for recovery from interiors o	274
Solids/Recovery of viable microorganisms from	289
Solutions/Comparison of sterilizing properties of formaldehyde	197
Sonic and ultrasonic waves/Sterilizing effects of high-intensi	283
Sonication method for removal of microorganisms from surfaces/	342
Sono-chemical approach in sterilization problems/An investigat	228
Sound fields/Exposure of microorganisms to focussed and unfocu	58
Sound waves/Biological effects of high intensity	27
Space age/Sanitation in the	136
Space Biology Program/The ORNL	152
Space cabin atmospheres/An integrated program approach to the	255
Space-cabin atmospheres by ionic processing/Feasibility of rem	257
Space chambers/Microbial interaction between men and their enr	265
Spacecraft/Dry-heat sterilization for planetary-impacting	250
Spacecraft before sterilization/Techniques for the limitation	339
Spacecraft components/Thermal death studies on microbial spore	185
Spacecraft/Microbial contamination detected on the Surveyor II	354
Spacecraft/Microbiological burden on the surfaces of the AIMP	285
Spacecraft simulations/Contaminants from manned	276
Spacecraft/Sterilization of	118
Space-flight diet/Isolation of <i>MIMA</i> and <i>Herellea</i> from an exper	254
Space flight upon indigenous microflora of Gemini crew members	359
Space:Further rocket and balloon borne exposure experiments/Th	333
Space hardware/Factors influencing the detection and enumerati	261
Space/Life Into	311
Space missions/Microbiological constraints on long-term manned	300
Space probe sterilization/Microbiological aspects of	266
Space/Survival of microorganisms in	217
Space systems/Microbial bionomics in	286
Space vehicle components/Dry heat destruction of spores in sim	312
Space vehicle components/Ecology and thermal inactivation of m	200
Spectrophotometry as a means for identification of bacteria/In	28
Spore disinfection by urthan and its retardation by hydrostat	17
Spore recoveries from diatomaceous earth pellets used as prote	346

Spores/A probit method to interpret thermal inactivation of ba	72
Spores and soil organisms/Combined effects of ultra-high vacuu	155
Spores and some considerations for the sterilization of spacece	185
Spores at several temperatures in ultrahigh vacuum/Survival of	132
Spores by hydrostatic pressure/The retardation of thermal disi	18
Spores/Effect of dry heat upon dry bacterial	99
Spores/Effect of gamma and X-rays upon dry bacterial	100
Spores/Effect of moisture and air on the heat and irradiation r	355
Spores/Effect of space radiation on bacterial	114
Spores:Effects of storage and pH of the recovery medium/Relat	206
Spores, germinated spores, and vegetative cells of <u>Clostridium</u>	336
Spores/Heat activation and heat induced dormancy of <u>Bacillus s</u>	135
Spores in atmospheres of different water contents/Heat resista	218
Spores in dry heat in relation to sterilization of instruments	71
Spores in rocket propellants/Viability of <u>Bacillus Subtilis</u>	214
Spores in saturated and superheated steam/Graphical procedure	148
Spores in simulated space vehicle components/Dry heat destruct	312
Spores in vegetables in the temperature range of 250-290 deg F	51
Spores occluded in crystals to sterilization/Resistance of	324
Spores of <u>Bacillus cereus</u> /Sonic disruption of	85
Spores of <u>Bacillus globigii</u> and <u>Cacillus anthracis</u> by free avail	68
Spores of <u>Bacillus subtilis</u> var. <u>niger</u> /Rapid heat treatment of	65
Spores of <u>Clostridium botulinum</u> /Investigation of physiological	78
Spores of <u>Clostridium botulinum</u> /Mechanism of action of ultraso	350
Spores of <u>Clostridium botulinum</u> /Studies on factors affecting h	25
Spores of some <u>Bacillus</u> species/The viability of	233
Spores of Type E <u>Clostridium botulinum</u> at optimal and suboptim	295
Spores on paper carriers/Preliminary studies of heat resistanc	88
Spores stored for long periods in buffer substrates/Influence	89
Spores/Studies of the heat resistance of bacterial	44
Spores/Studies on tract elements in the sporulation of bacteri	193
Spores/Survival of <u>Clostridium botulinum</u>	199
Spores to superheated steam/The resistance of bacterial	49
Spores/The effects of Beta-propiolactone on bacterial	50
Spores/The effect of nickel-cadmium batteries upon bacterial	166
Spores with low-voltage electrons/The irradiation of bacterial	36
Sporicidal test to evaluating efficiency of sterilizing device	319
Sporicides and heat to sterilize resins/Use of	167
Sporulation mutations induced by heat in <u>Bacillus subtilis</u> /	340
Sporulation of bacterial and the germination of bacterial spor	193
Sporulation on <u>Bacillus cereus</u> in some synthetic media and the	26
Stability of disseminated aerosols of <u>Pasteurella tularensis s</u>	76
Staff/Dispersal of <u>Staphylococcus aureus</u> by patients and surgi	202
Stainless steel, aluminum, glass and lucite/Comparison of the	229
Standardization of a method for sampling surfaces for microbio	219
Staphylococcal contamination: a study by a new method/Environm	95
Staphylococcal infections/Role of airborne transmission of	278
Staphylococci by the hands of personnel/The transmission of	224
Staphylococcal infection/The epidemiology and prevention of	180
<u>Staphylococcus aureus</u> /An experimental method to measure the in	162
<u>Staphylococcus aureus</u> /Comparison of the bactericidal effect of	86
<u>Staphylococcus aureus</u> /Open operating room doors and	125
<u>Staphylococcus aureus</u> by patients and surgical staff/Dispersal	202
<u>Staphylococcus aureus</u> in air of an operating room/	83
<u>Staphylococcus aureus</u> in the enVironment. II. Effect of elevat	189
<u>Staphylococcus aureus</u> in the environment. I. Exposure on surfa	163

<u>Staphylococcus epidermidis</u> populations/Comparison of methyl-br	341
Statistical problems in the standardization of a method for sa	219
Steam/Graphical procedure for comparing thermal death of <u>Bacil</u>	148
Steam/The resistance of bacterial spores to superheated	49
Sterilant/Propiolactone as a	75
Sterility/Sterility tests and methods for assuring	56
Sterility testing/Laminar air flow	315
Sterilization by electrohydraulic treatment/	243
Sterilization/Development of a biological indicator for dry he	323
Sterilization, disinfection, fumigation and sanitization	2
Sterilization/Feasibility study for combined method of	207
Sterilization for hospitals and related care facilities/A guid	164
Sterilization for planetary-impacting spacecraft. Dry-heat	250
Sterilization/Investigation of gamma	40
Sterilization/Microbiological aspects of space probe	266
Sterilization of activated carbon/Heat	288
Sterilization of instruments and materials with Beta-propiolac	84
Sterilization of instruments and syringes/Thermal death-time o	71
Sterilization of medical products/Code of practice for radiati	245
Sterilization of microorganisms at 105°C/A study of dry heat	284
Sterilization of microorganisms/Physical methods of	13
Sterilization of naturally contaminated metal surfaces with dr	168
Sterilization of soil by irradiation and some further observat	141
Sterilization of spacecraft/	118
Sterilization of spacecraft components/Thermal death studies on	185
Sterilization of surgical instruments/The role of disinfection	14
Sterilization of suspensions of <u>Serratia marcescens</u> and spores	65
Sterilization problems/An investigation of a sono-chemical app	228
Sterilization problems/Research on microbiological	348
Sterilizing properties of formaldehyde-methanol solutions with	197
Sterilization/Resistance of spores occluded in crystals to	324
Sterilization/Some biological and physical factors in dry heat	177
Sterilization/Status Letter Report Nos. 1 and 2 on propellant	129
Sterilization studies/Quantitative spore recoveries from diato	346
Sterilization/Survey of certain nonthermal methods of decontam	299
Sterilization/Techniques for the limitation of biological load	339
Sterilization temperatures/Prevention of protein denaturation	318
Sterilization times/Analytical method for calculating heat	80
Sterilization times for fermentation media/Microbiological pro	59
Sterilization with methyl bromide vapor/	270
Sterilize resins/Use of sporicides and heat to	167
Sterilizing agents on microorganisms/Effect of	173
Sterilizing devices and sporicidal chemicals/Application of A.	319
Sterilizing effect of high intensity airborne sound and ultra	249
Sterilizing effects of high-intensity airborne sonic and ultra	283
Storage and pH of the recovery medium/Relationship between hea	206
Storage study of disinfectant. Germicidal and fungicidal/Long	227
Strains of the same species/Factors involved in the control of	77
Stratosphere: Results of 6 experimental flights/Microbial expl	181
Stratospheric aerosols/Mechanical methods for collecting	187
Stress conditions/The general and comparative biology of terre	352
Studies at Hughes Aircraft Co./Microbiological sampling	210

Substances in commonly used culture media/On the demonstration	1
Sucrose solutions/Relative humidity and the killing of bacteria	151
Suit microbiology/Pressure	337
Suits and personal hygiene/Full pressure	335
Surface by handling/Microbial contamination of a	231
Surface contamination/	178
Surface decontamination rates/The effect of ultrasonic agitation	31
Surface levels/A soluble gelatin foam sampler for airborne micro	42
Surface sampling technic to the evaluation of bacteriological	196
Surfaces/An improved sonication method for removal of microorg	342
Surfaces/Factors influencing the recovery of viable microorgan	290
Surfaces for microbiological contamination/Some statistical pr	219
Surfaces of the AIMP spacecraft. Microbiological burden on	285
Surfaces/Survival of bacteria on metal	307
Surfaces/Survival of <u>Staphylococcus aureus</u> in the environment	163
Surfaces: the vacuum probe sampler/A new approach to the micro	325
Surfaces. I. Tissue phase/Disinfection of aerosolized pathogen	160
Surfaces/Use of ultrasonics in assessing microbial contaminati	349
Surfaces with dry heat/Sterilization of naturally contaminated	168
Surgeons scrubbed or unscrubbed/	201
Surgical instruments/The role of disinfection in veterinary me	14
Surgical theater/Laminar air flow in the	338
Surveyor II spacecraft/Microbial contamination detected on the	354
Survival of airborne microorganisms. III Effects of temperature	35
Survival of asporogenous bacteria/	46
Survival of bacteria during and after drying/The	23
Survival of bacteria in dust. II. The effect of atmospheric hu	19
Survival of bacteria on metal surfaces/	307
Survival of cryogenic whole air sampling conditions/Determinat	223
Survival of microbial aerosols: Experimental observations and	143
Survival of microorganisms in space/	217
Survival of microorganisms in space: Further rocket and balloo	333
Survival of respiratory pathogens dispersed into the environme	16
Survival of <u>Serratia marcescens</u> dehydrated by concentrated glyc	151
Survival of <u>Shigella sonnei</u> on cotton, glass wood, paper and m	144
Survival of spores at several temperatures in ultrahigh vacuum	132
Survival of <u>Staphylococcus aureus</u> in the environment. I. Expos	163
Survivor curves of <u>Bacillus subtilis</u> /Comparison of wet and dry	328
Survivor-time curve/Studies on bacterial populations in soluti	109
Symposium on Aerobiology/The First International	195
Synthetic media and the heat resistance of the spores produced	26
Technic to the evaluation of bacteriological effectiveness of	196
Techniques for recovery from interiors of solids/Microbiologi	274
Techniques for the inhibition of bacterial growth in liquid me	216
Technology and its application to parenteral operations/Aerosp	343
Temperature and relative humidity/The effect of sampling metho	64
Temperature extremes/Response of fungi to diurnal	321
Temperature in the killing of spores by dry heat/Observations	52
Temperature on surface-exposed Staphylococci/Survival of <u>Staph</u>	189
Temperature on the viability of some spores and soil organisms	155
Temperature range of 25-290 deg F./Thermal resistance of putre	51

Temperatures/Effect of sodium chloride and pH on the outgrowth	295
Temperatures in ultrahigh vacuum/Survival of spores at several	132
Temperatures/Prevention of protein denaturation during exposur	318
Temperatures/The survival of airborne microorganisms. III. Eff	35
Temperatures/The survival of <u>Shigella sonnei</u> on cotton, glass	144
Temperatures/Thermal inactivation characteristics of <u>Bacillus</u>	209
Temperatures in ultrahigh vacuum/Survival of spores at several	132
Temperatures on viability of bacterial spores stored for long	89
Tests and methods for assuring sterility/Sterility	56
Thermal death of <u>Bacillus stearothermophilus</u> spores in saturat	148
Thermal death studies on microbial spores and some considerati	185
Thermal disinfection of <u>Bacillus subtilis</u> spores by hydrostati	18
Thermal inactivation of microbes in and on interplanetary spac	200
Thermal resistance of putrefactive anaerobe No. 3679 in vegeta	51
Time and temperatures in the killing of spores by dry heat/Obs	52
Tissue cultures/Use of laminar air flow	313
Transmission of staphylococci by the hands of personnel/The	224
Ultrahigh temperatures/Heat injury of <u>Bacillus subtilis</u> spores	208
Ultrasonic agitation on surface decontamination rates/The effe	31
Ultrasonic technique for the inactivation of biological waste/	234
Ultrasonic waves/Sterilizing effects of high-intensity airborn	283
Ultrasonics in assessing microbial contamination on surfaces/U	349
Ultrasonics of spores of <u>Clostridium botulinum</u> /Mechanism of ac	350
Ultrasound/Sterilizing effect of high intensity airborne sound	249
Ultraviolet irradiation/Delayed recovery of airborne <u>Serratia m</u>	93
Ultraviolet irradiation in a room air conditioner for removal	30
Ultraviolet irradiation of microorganisms/Theoretical consider	116
Ultraviolet irradiation of the operating room and of various o	184
Ultraviolet light on <u>Staphylococcus aureus</u> /Comparison of the b	86
Ultraviolet light/The influence of growth media on proteins bo	357
Ultraviolet radiation/Bacterial resistance to	67
Urethan and its retardation by hydrostatic pressure/The accele	17
Vacuum and temperature on the viability of some spores and soi	155
Vacuum on <u>Bacillus subtilis</u> var. <u>niger</u> ./Effect of ultra-high	142
Vacuum on viability of microorganisms/Effect of ultrahigh	122
Vacuum probe sampler/A new approach to the microbiological sam	325
Vacuum/Survival of spores at several temperatures in ultrahigh	132
Vacuum/The viability of microorganisms in ultra-high	111
Variation in sensitivity of different strains of the same spec	77
Vegetative bacteria from eccofoam FP and diatomaceous earth/Re	347
Vegetative cells of <u>Clostridium botulinum</u> /Effect of suspending	336
Veterinary medicine. I. Sterilization of surgical instruments/	14
Viability and the pathogenicity of <u>Staphylococcus aureus</u> /An ex	162
Viability associated with variation in morphology of color var	61
Viability of air-borne bacteria. I. Bacteria aerosolized from	82
Viability of bacterial spores stored for long periods in buffe	89
Viability of microorganisms/Effect of ultra-high vacuum on	122
Viability of microorganisms in ultra-high vacuum/The	111
Viability of selected microorganisms in hydrocarbon fuels/	158
Viability of some spores and soil organisms/Combined effects o	155

Viability of spores of some <u>Bacillus</u> species/The	233
Virucidal activity of B-propiolactone vapor. I. Effect of B.	79
Virucidal activity of B-propiolactone vapor. II. Effect on t	92
Virucidal properties of peracetic acid/The	7
Visible light with ultraviolet light on <u>Staphylococcus aureus</u> /	86
Vitamin K ₅ and certain analogs in model systems and in foods/M	171
Waste/An ultrasonic technique for the inactivation of biologi	234
Water availability related to microbial growth/Effect of redu	332
Water content with external relative humidity or osmolality/R	128
Water contents/Heat resistance of <u>Bacillus subtilis</u> spores in	218
X-rays on <u>E. coli</u> /Studies in the mode of action of ionizing r	45
X-rays upon dry bacterial spores/Effect of gamma and	100
Yeasts and molds/Relative resistances of microorganisms to ca	48

IV. Author Index

The following is a listing of all authors, whether sole or one of multiple authors whose works are cited in this bibliography. The numbers at the right refer to the bibliographical citation number.

I. Preface

PREFACE

The citations listed in these bibliographies were compiled from the files of the Biological Sciences Communication Project for their relevancy to the areas of interest of the National Aeronautics and Space Administration's Office of Planetary Quarantine.

Volume I, Policy, includes references related to analysis of the sterilization requirements, conference proceedings and background information on NASA's position concerning spacecraft sterilization and planetary quarantine.

Volume II, Environmental Microbiology, is concerned with citations involving microbial growth, detection, identification and monitoring throughout spacecraft fabrication. Citations involving contamination control are relatively few, since this area was covered in an earlier bibliography.

Volume III, Engineering Parameters, incorporates material on air sampling, development and testing of spacecraft components, instrumentation, sterilization and decontamination procedures and spacecraft design.

These three volumes, together with two previously published (CLEAN ROOMS, ETHYLENE OXIDE), comprise over 1,200 citations bearing on the spacecraft sterilization problem. Their purpose is to provide essential background material for the further development and publicizing of the planetary quarantine program in the United States.

II. Bibliography on Engineering Parameters

ENGINEERING REQUIREMENTS

1. FARKAS, J.A. Environmental tensile testing of nylon parachute materials. In: II. Space Technology. Greenbelt, Md., Goddard SFC. p. 684-692.
2. MARGARD, W.L. and LOGSDON, R.F. An evaluation of the bacterial filtering efficacy of air filters in the removal and destruction of airborne bacteria. Jour. Amer. Soc. of Heating, Refrig. and Air-Conditioning Eng. 6 p.
3. NOWITSKY, A.M. Apollo sterilization. Sunnyvale, Calif., Lockheed Missiles and Space Co. 31 p.

1945

4. MAY, K.R. The Cascade Impactor: an instrument for sampling coarse aerosols. Jour. Sci. Instr. 22:187-195. Oct. 1945.

1948

5. BOURDILLION, R.B., LIDWELL, O.M. and SCHUSTER, E. An improved slit sampler with accurate timing. In: Studies in Air Hygiene. 12 p. Medical Res. Counc., Special Repts. Series No. 262. London, His Majesty's Stationery Office. 1948.

1949

6. FERRY, R.M., FARR, L.E. and HARTMAN, M.G. The preparation and measurement of the concentration of dilute bacterial aerosols. Chem. Rev. 44:389-414. Apr. 1949.

III. Permuted Index

Key words in the title of each of the articles referenced in this work have been rotated to the beginning of the title and alphabetized.

Thus, if one should search for "temperature gradients within component parts" it would appear alphabetically at the beginning of the line for all titles in which it actually occurs.

The number at the right refers to the bibliographical citation number.

SYNOPSIS OF ACTIVITIES

The following paragraphs describe the major activities of the BSCP during the contractual period of January 1 - December 31, 1967.

1. During this contractual period, "Scientific Publications of the Bioscience Programs Division" has been compiled in six volumes and distributed to more than 400 NASA associated bioscientists. These reports contain bibliographic citations of publications resulting from activities supported by this division of the NASA. Appropriately, author and permuted title indexes, the organizational affiliation of the senior authors, and in some cases, a literature analysis of the subject fields were also included. These six volumes issued as five reports were previously submitted to NASA as they were completed.
2. A compilation of the NASA contractual listings of publications was made for the convenience of four of the Bioscience Programs Division's Branch Chiefs. The projects were indexed according to principal investigator, performing organization and contract number. These four reports, compiled to provide some assistance in the constructive appraisal of the research activities in the respective fields of pursuit, were previously submitted to the NASA as they were completed.
3. Five issues of the Bioscience Capsule have been sent to more than 450 contractors and grantees of the Bioscience Programs Division and other NASA related bioscientists. These issues emphasized the activities of the various program branches and have been especially well received by the professional community. The October 30 issue describing the activities of the Advanced Programs and Technology Branch is enclosed with this report. Earlier issues have been previously distributed to NASA.
4. The Biospace Data Bank has been subjected to continuous updating. All references in the bibliographic file were subjected to review and a large number of them have been discarded because they were not sufficiently pertinent to the interests of the Bioscience Programs Division of NASA. To date, there are 11,100 abstracted references in the Termetrex System. The directory of space biologists and laboratories participating in research related to space bioscience has also been subjected to continuous updating. The depository of all the publications and reports supported totally or in part by the Bioscience Programs Division has continued to expand.
5. In cooperation with the University of Virginia transcriptions were made of various presentations of the Biospace Technology Institute held at Wallops Station in October of 1965 and 1966. All material

regarding this activity has been transmitted to the Behavioral Biology Branch chief and this transaction completed the BSCP's commitment in this regard to date.

6. The BSCP has responded to a large number of queries for information concerning space bioscience from academic, industrial, governmental, and other institutions. These queries have averaged in number about eight a month. Although they have been somewhat less frequent in the last few months this is normal for this time of the year. In response to these queries both general and technical information was provided to the extent that seemed most appropriate.
7. Critical reviews of Dr. J. P. Henry's manuscript "The Role of Cultural Change in the Increase of Blood Pressure with Age" were obtained from appropriate authorities in the fields of anthropology and medical science. These comments were forwarded to the chief of the Behavioral Biology Branch.
8. Services have been provided to the Advanced Programs and Technology Branch consisting of a system designed information processing procedure to provide assistance in the surveillance of developing technology, programming, scheduling, and other factors related to the scientific and technical efforts of the Bioscience Programs Division. This specific information service was designed to assuage the difficulties and problems concerned with the planning of in-flight bioscience experiments and related activities with the assistance of the Tri-Delta Corporation.
9. At the request of Dr. Bernard Newsom, the BSCP has provided the collaborators of the Monograph Series #19 with eighteen basic references pertaining to their interests and compiled a bibliography on Radiobiology containing 514 references taken from the bibliographic section of the Biospace Data Bank. In this report, only papers from 1959-1967 were included. An author index and a permuted title index with appropriate descriptors added, were also included to permit rapid entry to the more specific items of interest to the reader. It was felt that this report would also be helpful to the compiler of Monograph #7 and, accordingly, copies were also sent to him. Dr. Newsom seemed sure that this work would be of considerable help in the preparation of his manuscript, and he has been assured that should he so desire, the BSCP would make any reasonable attempt to obtain hard copies of any of the documents cited to assist him. This work is illustrative of the type of services the BSCP can render in support of this activity.
10. Outlines have been received for three monographs (#2, #9, and #15) to date and Dr. Roth, compiler of monograph #8, has promised his completed draft manuscript by early January 1968. All outlines received have been approved by Orr Reynolds and the first payment to these compilers is being processed.

Contracts were negotiated during the past three months with Claude Zobell (co-author with Dale Jenkins for monograph #3) and with Gerald Silverman (one of several co-authors with Larry Hall for monograph #6). An outline has been received from and a contract is being negotiated with Ralph Rohweder for a separate monograph, "Two-way Feedback Between Experimental Biology and the Applied Biological Sciences of Medicine, Agriculture, and Conservation".

A change of authors has occurred with two monographs: monograph #17, to be prepared originally by R. S. Johnston, will be written now by Walton Jones, NASA Headquarters, and monograph #19, to be prepared originally by R. W. Lawton, will be written now by Charles Berry, NASA, Houston. All other items are as previously reported.

11. During the year, three short courses titled, "Environmental Microbiology for Engineers", were held at Cape Kennedy, Huntsville, and the Jet Propulsion Laboratory in February, June, and October, respectively. More than 100 students attended these courses and an even larger number of auditors attended the classes. The professional community continues to express an active interest in this activity and preliminary plans have been made to hold the next course either at Langley Research Center or Kennedy Space Center.
12. There has been a large demand for documents of interest to Planetary Quarantine during this period. During this year, more than 12,000 pages of information have been sent to grantees and contractors and related bioscientists of this program branch. Special information searches were made during the last quarter in the following areas: a) Microbial fallout from human beings, for Fort Detrick, b) Background material for a United Nations Conference on the Peaceful Uses of Space, requested by the Karolinski Institute, Sweden, c) Studies on sterilization by irradiation for Goddard Space Flight Center, d) A ten page report on the implementation of the Planetary Quarantine Program. Large requests made during earlier quarters have already been reported in the appropriate quarterly reports.
13. The BSCP has been functioning as a technical monitor for the preparation of a film, "Planetary Quarantine". Activities on this project included the critical review and editing of part of the script for the film made by the Audio-Visual Facility at CDC. This activity has necessitated many trips to CDC and JPL. This film was reviewed by NASA officials and was found to be in need of further refinement due to the rescheduling of the NASA's planetary exploration timetable. The main item of this film, the Voyager Program, has now been rendered obsolete because of these program changes.

14. A bibliography on the applications of Ethylene Oxide was prepared and distributed to the contractors of the Planetary Quarantine Program. A total of 137 references were cited and appropriately indexed by author and title. This report has already been submitted to NASA at an earlier date.
15. A three volume bibliography containing a total of 750 citations has been compiled to provide essential background material for the future development and enlightenment of the planetary quarantine activities in the U.S. These citations have been separated into three parts - policy, engineering problems, and environmental microbiology. Copies of these documents are enclosed with this report.
16. In support of a presentation on sterilization techniques made by the chief of the Planetary Quarantine Program at the London COSPAR meeting, a bibliography of the pertinent literature has been prepared.
17. At the request of the chief of Bioscience Communications, three weeks was spent at the Wallops Station in participation of the Biospace Technology Training Program. A ninety minute presentation on NASA's policy on Planetary Quarantine and Spacecraft Sterilization programs was made. A small reference library of 100 volumes was also made available to the students for use during this course. A quantity of reprints and NASA publications were distributed to the students and requests for additional publications were referred to the program manager of the Bioscience Communications portion of this contract. A critique of the program has been prepared and sent to the appropriate program chief.

During this contractual period the various endeavors of the BSCP have resulted in the publication of fourteen reports resulting from the activities of this contract. A bibliography of these reports is included herein.

ADVANCED PROGRAMS AND TECHNOLOGY REPORT

The Advanced Programs and Technology Branch of the National Aeronautics and Space Administration's Bioscience Programs Division serves various functions within the Division. It seeks out flight space for bioscience experiments, organizes experiments into compatible groups and matches them with mission profiles, schedules, communication and tracking needs. In some instances, usually where small experiments are involved, it will carry out research program management.

Perhaps one of its most important functions is that of making a continuing inventory of the status of research proposals and grants. Here the Branch is expected to maintain visibility into what research ideas are in which formative stages and what is required before a research idea can be flown, and to forecast the volume of future bioscience flight activities that will flow from the research pipeline. It takes about two years for a simple research proposal to mature into a flight experiment, and it takes five to ten years for more complicated ones. This means that long-range "production planning" techniques are needed to insure efficient meshing of valid experiments with flight opportunities.

With a staff that includes representatives from the biological sciences and engineering, the Advanced Programs and Technology Branch is well-equipped to carry out these functions. Moreover, they get support and guidance from an active American Institute of Biological Sciences (AIBS) Regional Council program which effectively injects into the planning the viewpoints of a wide cross-section of the nation's leading life scientists.

Among the flight programs being considered is Bio A. Generally, there are proposals from many potential investigators in various stages of approval or development. Bio A is a group of such experiments that has been proposed but not approved as yet for one of the Apollo Applications Program flights. Bio A experiments would be designed to determine the effects of a 60-day orbital flight with near zero g on monkeys or chimpanzees. The time course and extent of changes in the central nervous, cardiovascular, metabolic, and hemodynamic systems under conditions of prolonged weightlessness and removal from some of the Earth's periodicities would be studied. Some support has already been provided to potential investigators to proceed with their experiment definition work, preliminary design of instrumentation and sensor systems, and further baseline and physiological feasibility studies -- all necessary steps before the decision is made to fully support the mission.

Basically, the Bio A system consists of four primates, each in its own module that also contains associated instrumentation and life support equipment. One Bio A experiment, proposed by Dr. W. Ross Adey of the University of California at Los Angeles, will make a wide range of electrophysiological measurements on the central and peripheral nervous systems. Both behavior and motor activity of the animals will be monitored. Another Bio A experiment, proposed by Dr. Nello Pace of the University of California, Berkeley, will provide for automated chemical, fluorometric and optical analysis of body fluids. A complete metabolic balance will be made. The flight results should produce information on the causes of various changes observed, internal mechanisms involved, and the adaptation processes. This information will be useful for predicting the long-term effects of space environment on man and also for increasing our basic knowledge about the body's adaptations and reactions to, and dependence upon, certain components of the Earth's environment.

The Bio A experiments will draw heavily from experience with the 30-day Biosatellite flights, but will go significantly beyond the Biosatellite investigations in the number and kinds of measurements. The greater capacity of the manned AAP missions and the astronaut participation will also allow longer flight duration, more and larger animals, and physical enclosures adapted to the specific needs of the different experiments.

Another flight program being considered is BioPioneer. In the proposed automated BioPioneer spacecraft, specimens will be flown in a heliocentric orbit away from the Earth, and periodic rotation around the Earth, thereby totally removing the specimens from all such geophysical periodic influences known and unknown in an attempt to investigate circadian biological rhythmicity. The spacecraft, including 52 pounds of scientific instruments, will weigh about 162 pounds. The spacecraft is designed for six months in solar orbit. Two years is the development time required from "go-ahead" to first launch.

The Advanced Programs and Technology Branch also shares responsibility in the Biotechnology Laboratory studies that are considering the feasibility of flight facility for various life sciences experiments sponsored by the Office of Manned Space Flight, the Office of Advanced Research and Technology, and the Office of Space Science and Applications.

The Laboratory might be an orbiting facility dedicated to the biological sciences and medicine, with a possible orbit of six months or more. Experiments would range from microbiology to those involving higher-order mammals; an integrated medical laboratory for investigations on humans is also planned. Biologically and medically trained astronauts would be used in this flight.

As part of the Apollo Applications Program other experiments are being planned for flight. These plans include flying human liver cells to study effects of weightlessness, and flying pocket mice, vinegar gnat pupae, and potato cells to study circadian rhythms in Earth orbital flight. The potato cell experiment, for example, will investigate the well-studied rhythm observed in the oxygen consumption of a sprouting potato. We will learn if the rhythmicity of the potato cell respiration remains the same, is modified or disappears during orbital flight, thus casting light on a fundamental question in biology. The experiment design makes use of available baseline data and requires relatively simple equipment and monitoring by the astronauts during flight. A flight package consisting of respirometers containing potato plugs will be orbited. Recovery is not required. Identical control respirometers will be operating on Earth, and oxygen consumption will be measured every six minutes for long time periods.

Plans are also being considered for continuing the Biosatellite program after the presently approved six flights are completed. Preliminary examination of the data from the successful three-day Biosatellite recently flown indicates that some of the experiments need not be flown again but that it might be profitable to repeat others. The three-day flight strengthened the viewpoint that Biosatellite is a valuable research tool in planning for future payloads.

BSCP Publications Available

Four BSCP reports are now available, as long as the supply lasts, upon request from Biological Sciences Communication Project, Suite 700, 2000 P St., N. W., Washington, D.C. 20036.

Three of the reports are lists of publications resulting from research supported, sometimes in part, by the Physical Biology and the Environmental Biology Branches of the Bioscience Programs Division. For each project, indexed alphabetically according to principal investigator, the published activity of each contractual endeavor is cited: 137 citations in Physical Biology, more than 300 in Environmental Biology, and more than 400 in Exobiology.

The fourth publication, "Radiobiology: A Selected Bibliography," represents a selection of 514 radiobiology references drawn from the bibliographic section of the BSCP's Biospace Data Bank. Only papers from 1959 to date are included; citations are indexed using both an author index and a permuted title index, thereby "providing rapid entry to the more specific items of interest to the reader."
